

Undecidability

Decidability vs. Undecidability

- There are two types of TMs (based on halting):
 - (*Recursive*)
TMs that *always* halt, no matter accepting or non-accepting \equiv **DECIDABLE PROBLEMS**
 - (*Recursively enumerable*)
TMs that *are guaranteed to halt only on acceptance*. If non-accepting, it may or may not halt (i.e., could loop forever).
- **Undecidability:**
 - Undecidable problems are those that are not recursive

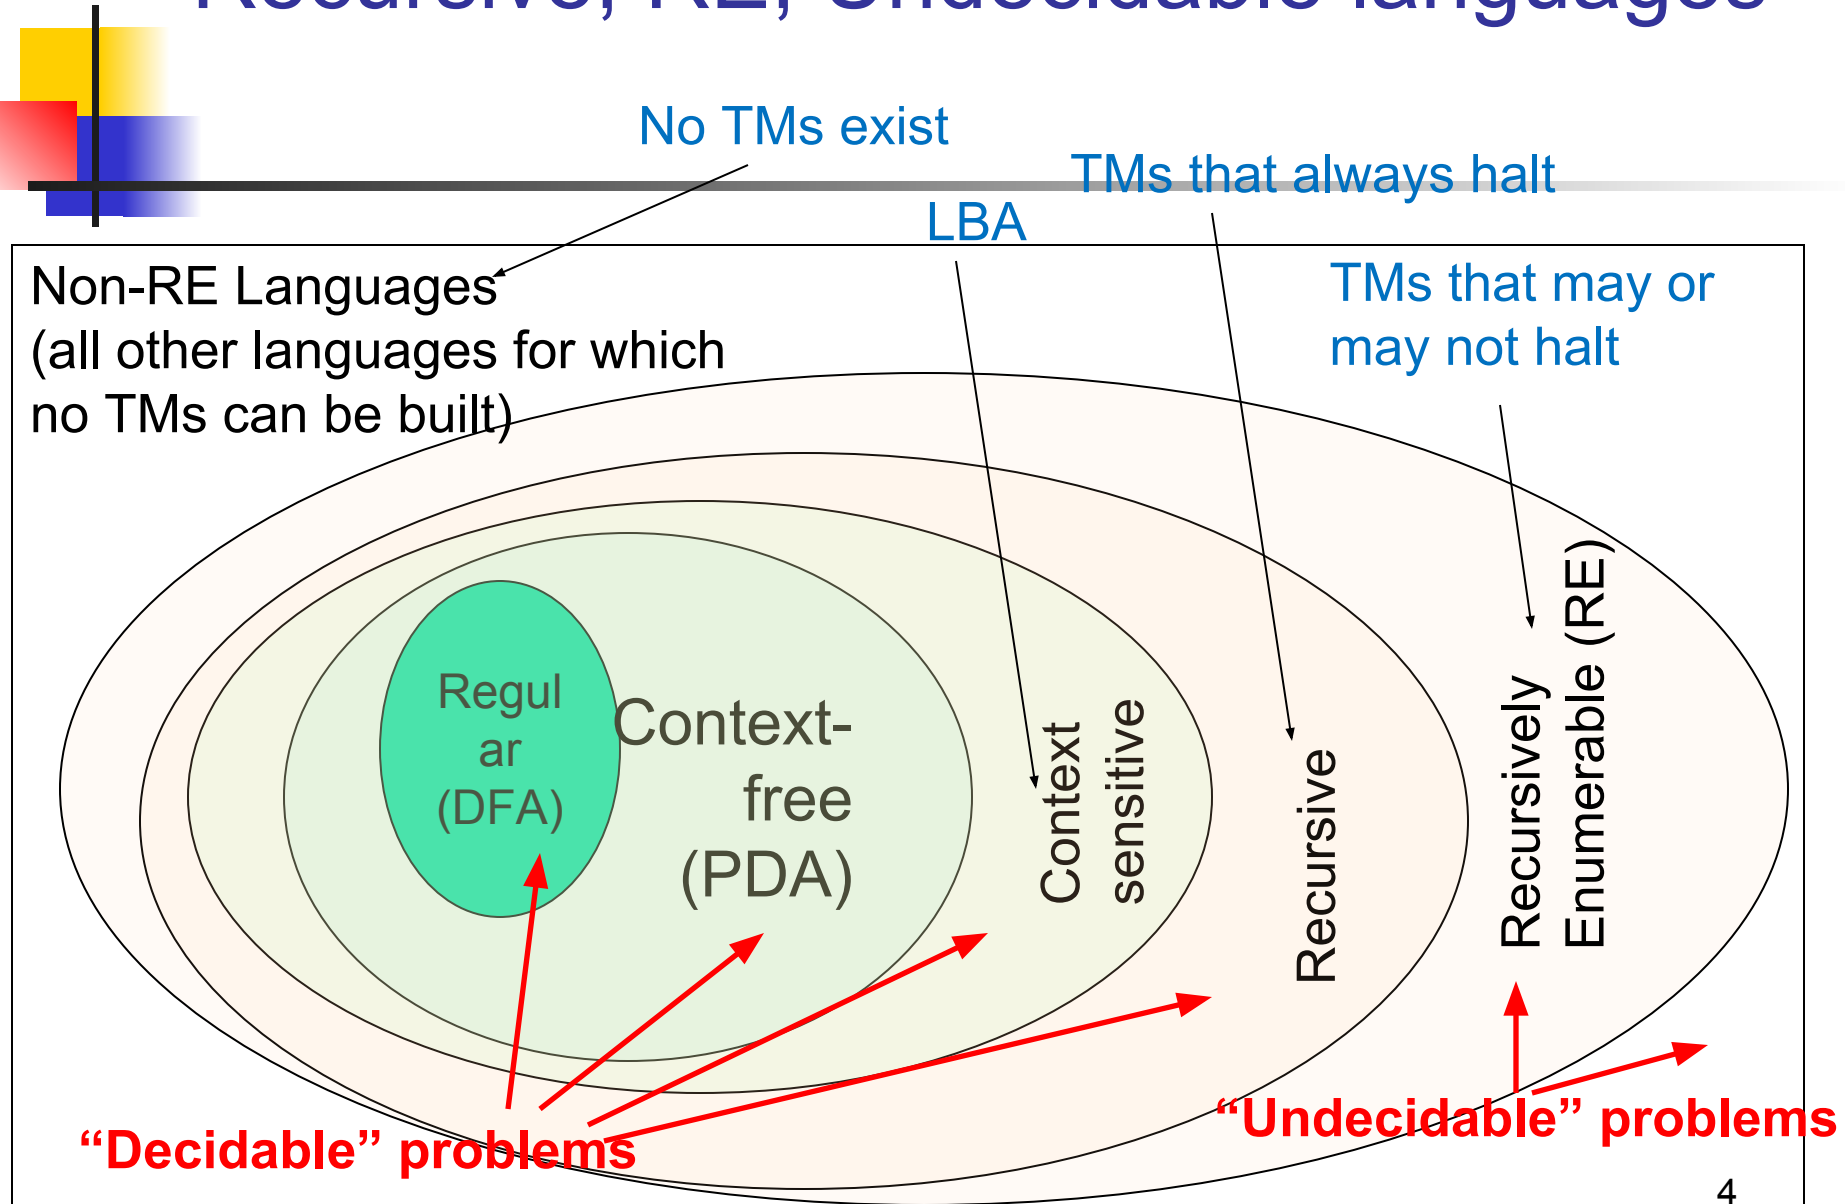

Recursive Language:

- A language 'L' is said to be recursive if there exists a Turing machine which will accept all the strings in 'L' and reject all the strings not in 'L'.
- The Turing machine will halt every time and give an answer (accepted or rejected) for each and every string input.

Recursively Enumerable Language:

- A language 'L' is said to be a recursively enumerable language if there exists a Turing machine which will accept (and therefore halt) for all the input strings which are in 'L'.
- But may or may not halt for all input strings which are not in 'L'.

Recursive, RE, Undecidable languages

Recursive Languages & Recursively Enumerable (RE) languages

- Any TM for a Recursive language is going to look like this:

- Any TM for a Recursively Enumerable (RE) language is going to look like this:

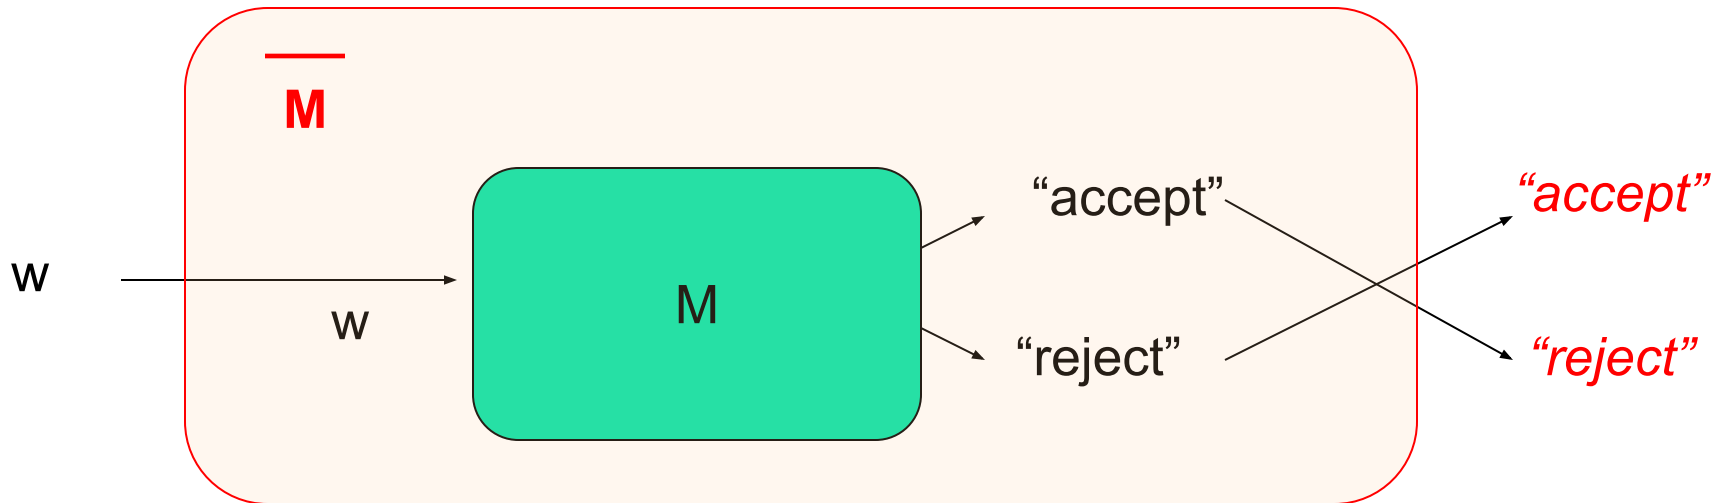

Closure Properties of:

- the Recursive language class, and
- the Recursively Enumerable language class

Recursive Languages are closed under complementation

- If L is Recursive, \overline{L} is also Recursive

Are Recursively Enumerable Languages closed under complementation? (NO)

- If L is RE, \overline{L} need not be RE

Recursive Langs are closed under Union

- Let $M_u = \text{TM for } L_1 \cup L_2$
- M_u construction:
 1. Make 2-tapes and copy input w on both tapes
 2. Simulate M_1 on tape 1
 3. Simulate M_2 on tape 2
 4. If either M_1 or M_2 accepts, then M_u accepts
 5. Otherwise, M_u rejects.

Recursive Langs are closed under Intersection

- Let $M_n = \text{TM for } L_1 \cap L_2$
- M_n construction:
 1. Make 2-tapes and copy input w on both tapes
 2. Simulate M_1 on tape 1
 3. Simulate M_2 on tape 2
 4. If M_1 AND M_2 accepts, then M_n accepts
 5. Otherwise, M_n rejects.

Other Closure Property Results

- Recursive languages are also closed under:
 - Concatenation
 - Kleene closure (star operator)
 - Homomorphism, and inverse homomorphism
 - RE languages are closed under:
 - Union, intersection, concatenation, Kleene closure
-
- RE languages are *not* closed under:
 - complementation

“Languages” vs. “Problems”

A “language” is a set of strings

Any “problem” can be expressed as a set of all strings that are of the form:

- “<input, output>”

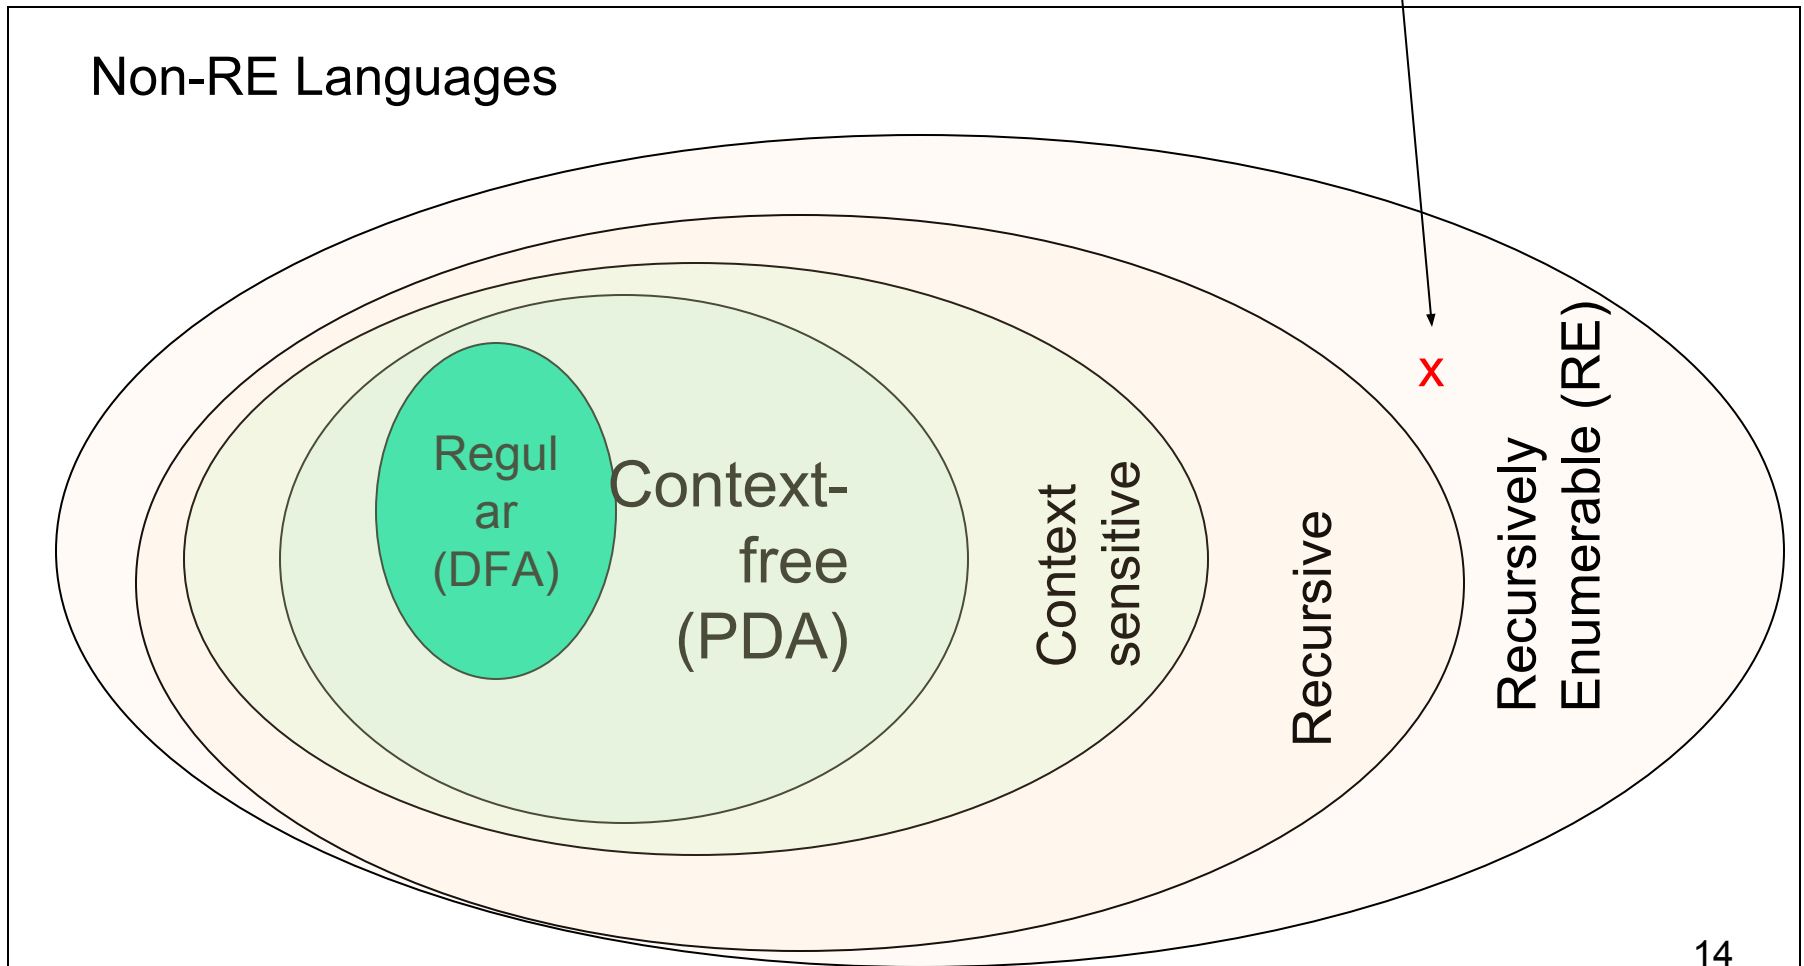

==> Every problem also corresponds to a language!!

The Halting Problem

An example of a recursive enumerable problem that is also undecidable

The Halting Problem

What is the Halting Problem?

Definition of the “halting problem”:

- *Does a given Turing Machine M halt on a given input w ?*

A Turing Machine simulator

The Universal Turing Machine

- Given: TM **M** & its input **w**
- Aim: Build another TM called “H”, that will output:
 - “*accept*” if M accepts w, and
 - “*reject*” otherwise

- An algorithm for H:
 - Simulate M on w

Implies: H is in RE

$$\text{■ } H(\langle M, w \rangle) = \begin{cases} \text{accept,} & \text{if } M \text{ accepts } w \\ \text{reject,} & \text{if } M \text{ does not accept } w \end{cases}$$

Question: If M does *not* halt on w, what will happen to H?

A Claim

- Claim: No H that is always guaranteed to halt, can exist!
- Proof: (Alan Turing, 1936)
 - By contradiction, let us assume H exists

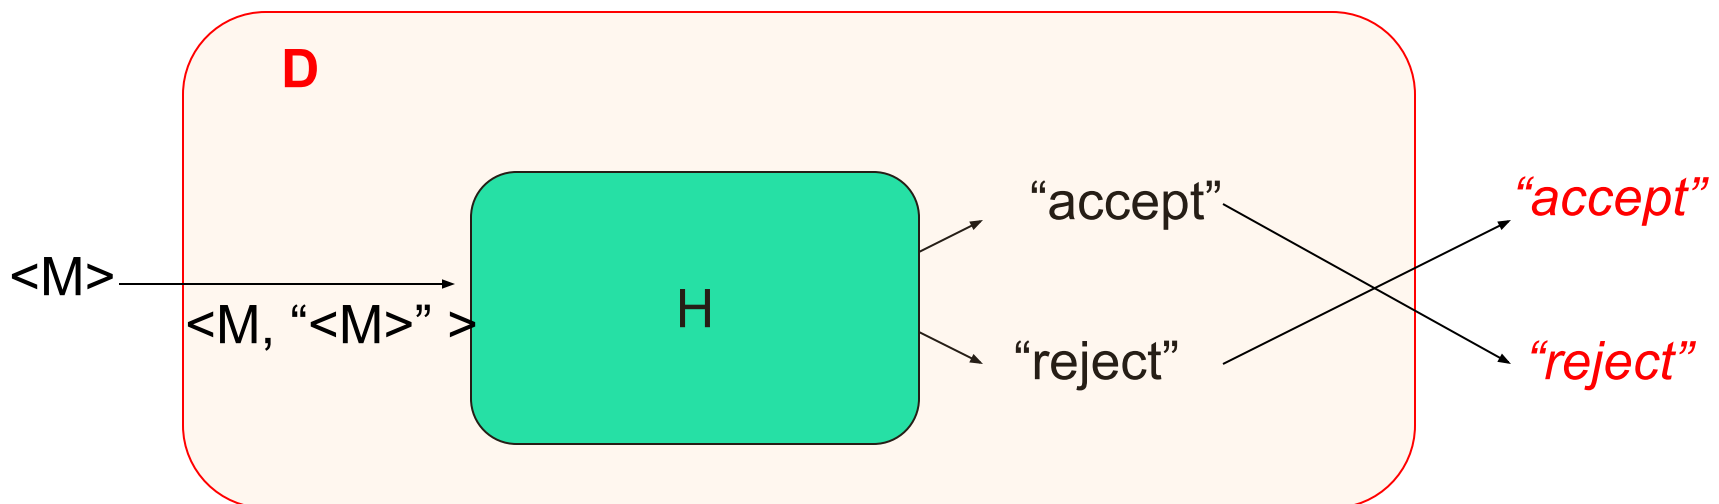

Therefore, if H exists \square D also should exist.

But can such a D exist? (if not, then H also cannot exist)

HP Proof (step 1)

- Let us construct a new TM **D** using H as a subroutine:
 - On input $\langle M \rangle$:
 1. Run H on input $\langle M, \langle M \rangle \rangle$; //(i.e., run M on M itself)
 2. Output the *opposite* of what H outputs;

HP Proof (step 2)

- The notion of inputting “<M>” to M itself
 - A program can be input to itself (e.g., a compiler is a program that takes any program as input)

$$D(<M>) = \begin{cases} \text{accept,} & \text{if } M \text{ does not accept } <M> \\ \text{reject,} & \text{if } M \text{ accepts } <M> \end{cases}$$

Now, what happens if D is input to itself?

$$D(<D>) = \begin{cases} \text{accept,} & \text{if } D \text{ does not accept } <D> \\ \text{reject,} & \text{if } D \text{ accepts } <D> \end{cases}$$

A contradiction!!! ==> Neither D nor H can exist.

Of Paradoxes & Strange Loops

E.g., Barber's paradox, Achilles & the Tortoise (Zeno's paradox)
MC Escher's paintings

A fun book for further reading:

***“Godel, Escher, Bach: An Eternal Golden Braid”
by Douglas Hofstadter (Pulitzer winner, 1980)***

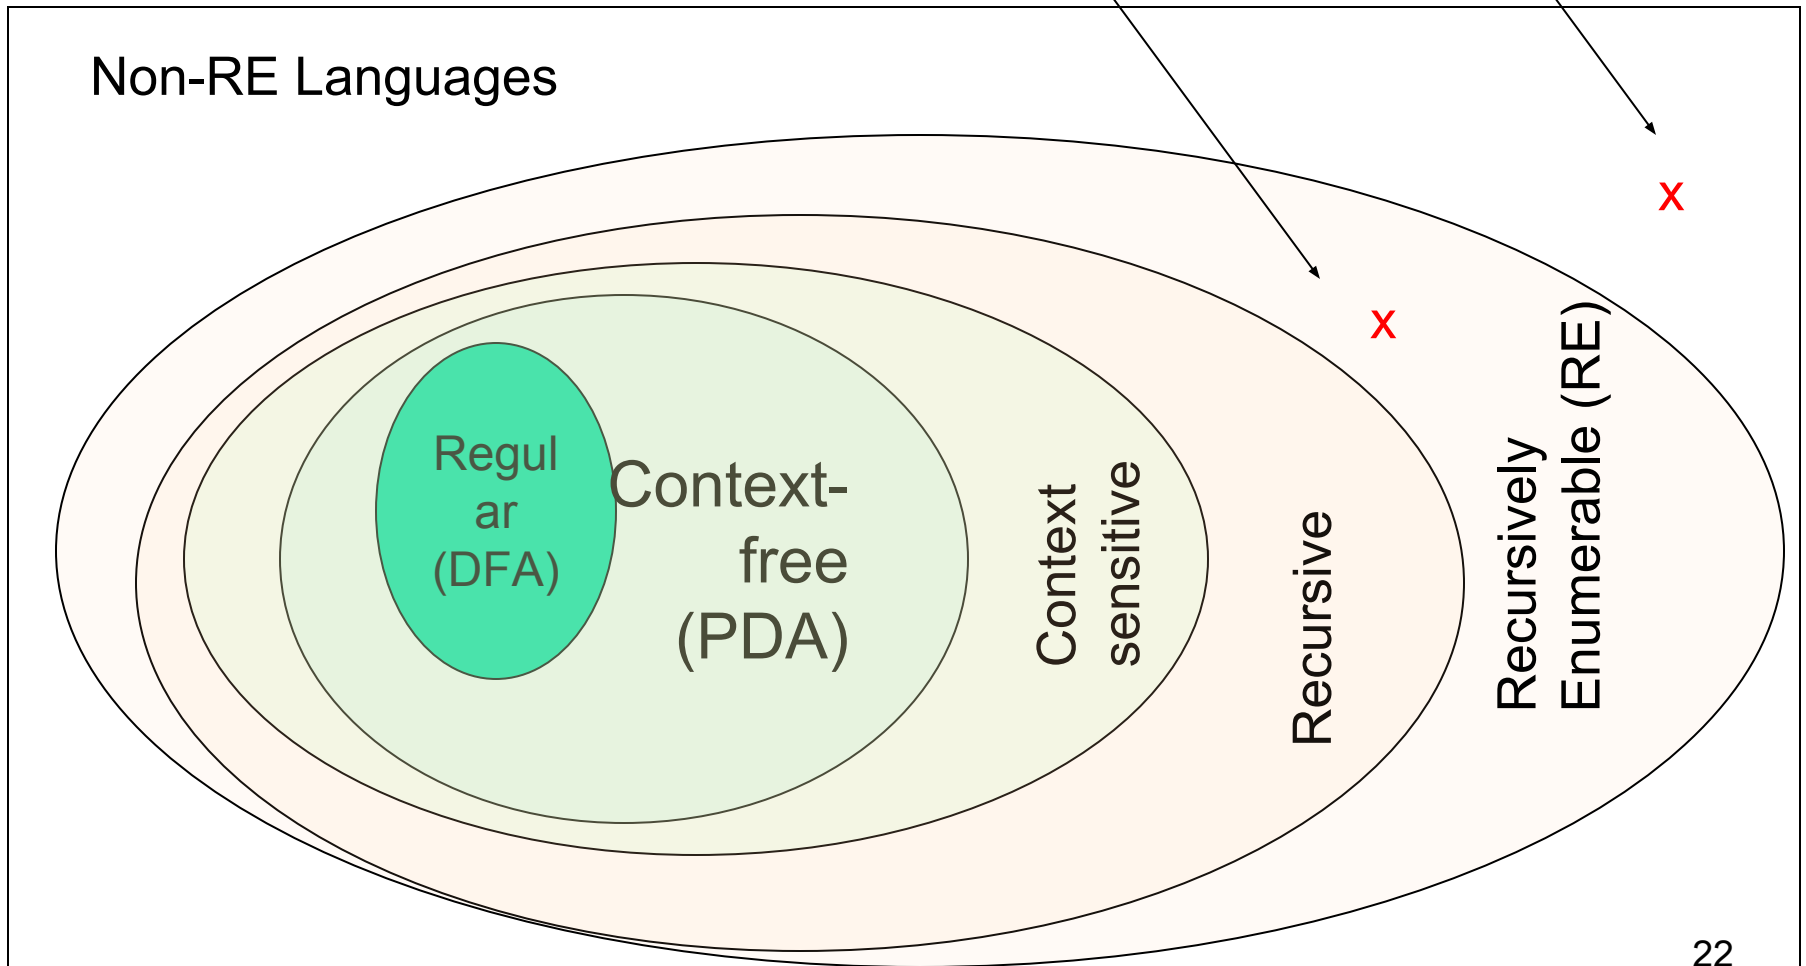

The Diagonalization Language

**Example of a language that is
not recursive enumerable**

(i.e, no TMs exist)

The Diagonalization language

The Halting Problem

A Language about TMs & acceptance

- Let L be the language of all strings $\langle M, w \rangle$ s.t.:
 1. M is a TM (coded in binary) with input alphabet also binary
 2. w is a binary string
 3. M accepts input w .

Enumerating all binary strings

- Let w be a binary string
- Then $1w \equiv i$, where i is some integer
 - E.g., If $w=\varepsilon$, then $i=1$;
 - If $w=0$, then $i=2$;
 - If $w=1$, then $i=3$; so on...
- If $1w \equiv i$, then call w as the i^{th} word or i^{th} binary string, denoted by w_i .
- **\Rightarrow A canonical ordering of all binary strings:**
 - $\{\varepsilon, 0, 1, 00, 01, 10, 11, 000, 100, 101, 110, \dots\}$
 - $\{w_1, w_2, w_3, w_4, \dots, w_i, \dots\}$

Any TM M can also be binary-coded

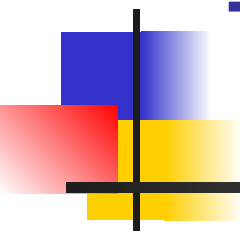

- $M = \{ Q, \{0,1\}, \Gamma, \delta, q_0, B, F \}$
 - Map all states, tape symbols and transitions to integers (\Rightarrow binary strings)
 - $\delta(q_i, X_j) = (q_k, X_l, D_m)$ will be represented as:
 - $\Rightarrow 0^i 1 0^j 1 0^k 1 0^l 1 0^m$
- Result: Each TM can be written down as a long binary string
- \Rightarrow Canonical ordering of TMs:
 - $\{M_1, M_2, M_3, M_4, \dots, M_i, \dots\}$

L_d is not RE (i.e., has no TM)

- Proof (by contradiction):
- Let M be the TM for L_d
- $\implies M$ has to be equal to some M_k s.t.
 $L(M_k) = L_d$
- \implies Will w_k belong to $L(M_k)$ or not?
 1. If $w_k \in L(M_k) \implies T[k,k]=1 \implies w_k \notin L_d$
 2. If $w_k \notin L(M_k) \implies T[k,k]=0 \implies w_k \in L_d$
- A contradiction either way!!

Why should there be
languages that do not have
TMs?

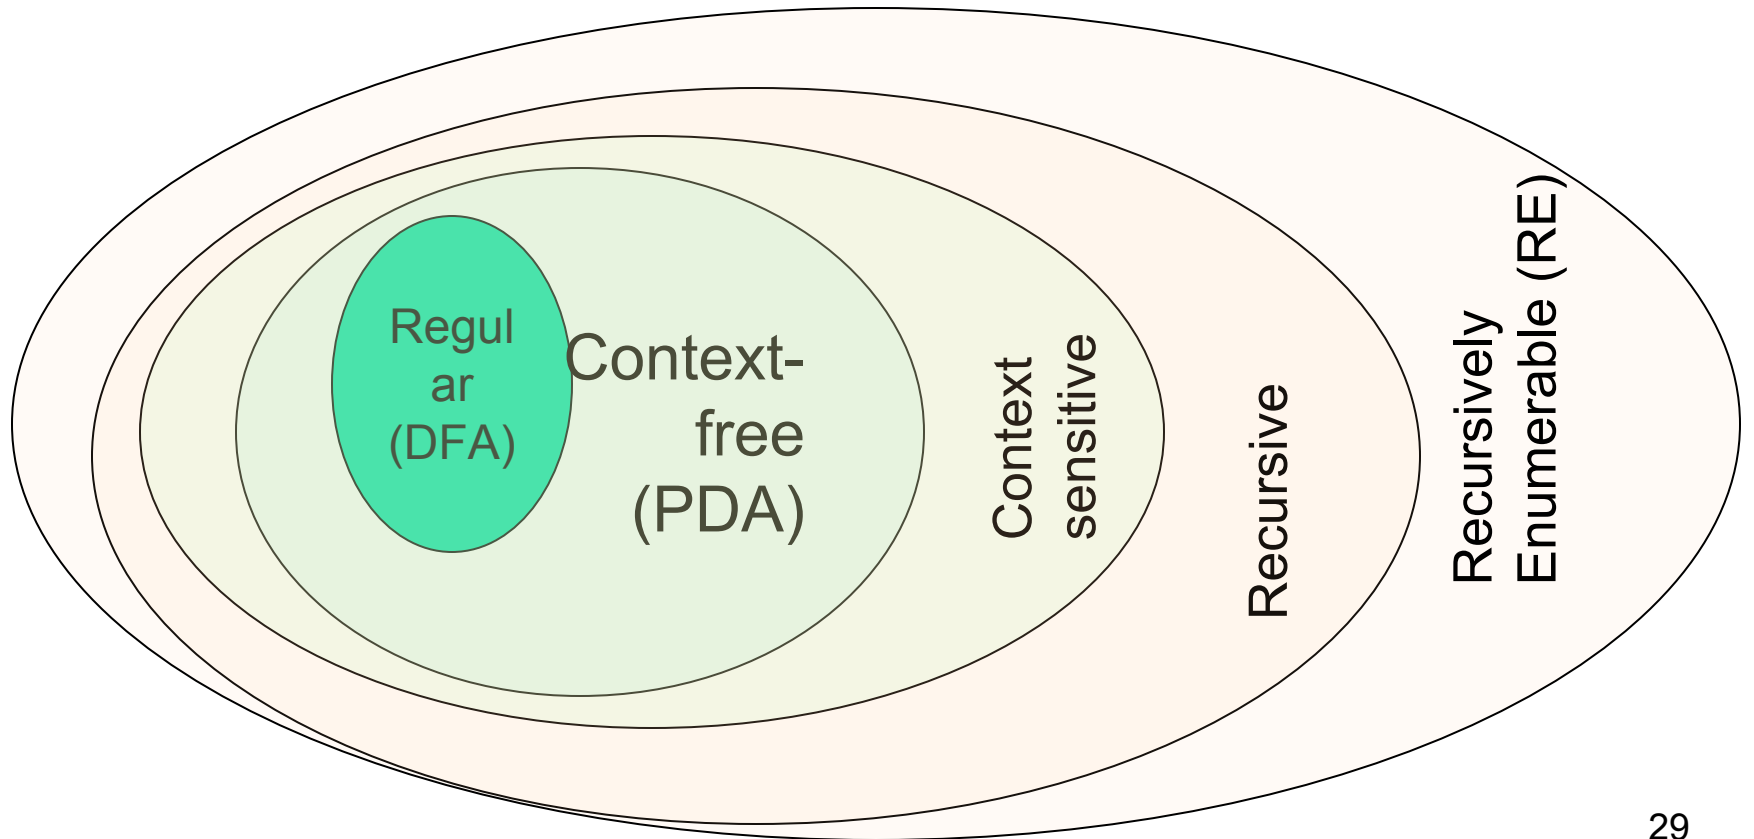

We thought TMs can solve
everything!!

Non-RE languages

How come there are languages here?
(e.g., diagonalization language)

Non-RE Languages

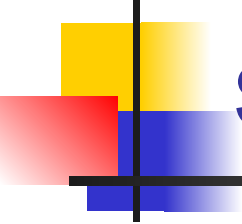

One Explanation

There are more languages than TMs

- By pigeon hole principle:
 - \implies some languages cannot have TMs
- But how do we show this?
- Need a way to “*count & compare*” two infinite sets (languages and TMs)

How to count elements in a set?

Let A be a set:

- If A is finite \implies counting is trivial
- If A is infinite \implies how do we count?
- And, how do we compare two infinite sets by their size?

Cantor's definition of set "size" for infinite sets (1873 A.D.)

Let $N = \{1, 2, 3, \dots\}$ (all natural numbers)

Let $E = \{2, 4, 6, \dots\}$ (all even numbers)

Q) Which is bigger?

■ A) Both sets are of the same size

■ "**Countably infinite**"

■ Proof: Show by one-to-one, onto set correspondence from

$N \Rightarrow E$

n	$f(n)$
1	2
2	4
3	6
.	.
.	.

i.e, for every element in N ,
there is a unique element in E ,
and vice versa.

Example #2

- Let Q be the set of all rational numbers
- $Q = \{ m/n \mid \text{for all } m, n \in \mathbb{N} \}$
- Claim: Q is also countably infinite; $\Rightarrow |Q| = |\mathbb{N}|$

Really, really big sets!
(even bigger than countably infinite sets)

Uncountable sets

Example:

- Let R be the set of all real numbers
- Claim: R is uncountable

n	$f(n)$
1	3 . <u>1</u> 4 1 5 9 ...
2	5 . 5 <u>5</u> 5 5 5 ...
3	0 . 1 2 <u>3</u> 4 5 ...
4	0 . 5 1 4 <u>3</u> 0 ...
.	
.	
.	

Build x s.t. x cannot possibly
occur in the table

E.g. $x = 0 . 2 6 4 4 \dots$

Therefore, some languages cannot have TMs...

- The set of all TMs is countably infinite
- The set of all Languages is uncountable
- \Rightarrow There should be some languages without TMs (by PHP)

Summary

- Problems vs. languages
- Decidability
 - Recursive
- Undecidability
 - Recursively Enumerable
 - Not RE
 - Examples of languages
- The diagonalization technique
